

AsakusaNight

A cinematic Unreal Engine boss-fight demo set in Asakusa, with victory minting an on-chain relic NFT

The Problem & Our Solution

Web3 games usually look cheap. We pair AAA-quality Unreal Engine visuals with a real on-chain reward tied to actual gameplay skill.

- Most Web3 games have weak graphics and shallow gameplay loops
- Our team has strong 3D/Unreal skills but no prior blockchain experience
- Solution: one gorgeous, playable Asakusa combat scene built in Unreal Engine 5
- Defeating the boss triggers a real Solana mint, not a fake claim button
- Shows judges that AAA visuals and on-chain ownership can merge in one demo

How It Works

Player fights a boss in a cinematic Asakusa street scene. Victory connects a Solana wallet and mints a unique relic NFT.

- Player explores a Kaminarimon-inspired street scene with dynamic Lumen lighting
- Boss encounter: combo attacks, dodge mechanic, and a defeat cinematic
- On defeat, HUD prompts a Solana Wallet Adapter connection screen
- Node.js backend trigger calls Metaplex Core to mint a 1-of-1 Spirit Seal NFT
- On-chain: a single Solana mint transaction records proof of the player's victory

Built with

Solana, Unreal Engine 5, Blender,
Metaplex Core, Solana Wallet Adapter,
Node.js backend for mint trigger,
Nanite/Lumen

Why Now & What's Next

Solana's speed and Metaplex's tooling make minting a real gameplay moment feasible inside a hackathon timeframe.

- Solana's low fees and fast finality fit a live, in-demo mint moment
- Metaplex Core simplifies 1-of-1 NFT minting without heavy custom contracts
- Next: expand to a full chapter with multiple enemies and story beats
- Next: dynamic NFT traits that evolve based on player performance
- Next: explore mobile/cloud streaming to reach players without high-end PCs
